If people change radically as a result of mental disturbance or brain damage or disease, how should we acknowledge that change in the way in which we respond to them? And how should society and the law acknowledge that change, particularly in cases of multiple-personality and manic-depressive disorders?

This book addresses these and a cluster of other questions about changes in the self through time and about the moral attitudes we adopt in the face of these changes. The result is a broad-ranging interdisciplinary discussion at the boundaries of psychiatry, philosophy, law, and social policy. Theories of personal identity are applied to, and clarified in light of, the appearance of multiple selves in a variety of personality and identity disturbances. Divided minds force us to clarify our thinking about human subjectivity, Radden points out, and when they result in a succession of "selves," they provoke interesting ethical and legal issues. Radden provides a clear and thorough discussion of basic issues faced by clinicians and philosophers contending with the unity of consciousness and personal identity, particularly in the area of dissociative disorders, where issues of unity of consciousness have a direct impact on clinical and forensic decisions. Part 1 takes up the divisions and heterogeneities associated first with the normal self and then with the pathological self and identifies a "language of successive selves." Part 2 provides an extended analysis of personal responsibility and culpability with regard to extreme multiplicity. Part 3 takes up the notion of a metaphysics of successive selves. And part 4 addresses theoretical concerns associated with clinical material in an effort to further our understanding of the concepts of self-consciousness and subjectivity. A Bradford Book

Since the publication of the Institute of Medicine (IOM) report *Clinical Practice Guidelines We Can Trust* in 2011, there has been an increasing emphasis on assuring that clinical practice guidelines are trustworthy, developed in a transparent fashion, and based on a systematic review of the available research evidence. To align with the IOM recommendations and to meet the new requirements for inclusion of a guideline in the National Guidelines Clearinghouse of the Agency for Healthcare Research and Quality (AHRQ), American Psychiatric Association (APA) has adopted a new process for practice guideline development. Under this new process APA's practice guidelines also seek to provide better clinical utility and usability. Rather than a broad overview of treatment for a disorder, new practice guidelines focus on a set of discrete clinical questions of relevance to an overarching subject area. A systematic review of evidence is conducted to address these clinical questions and involves a detailed assessment of individual studies. The quality of the overall body of evidence is also rated and is summarized in the practice guideline. With the new process, recommendations are determined by weighing potential benefits and harms of an intervention in a specific clinical context. Clear, concise, and actionable recommendation statements help clinicians to incorporate recommendations into clinical practice, with the goal of improving quality of care. The new practice guideline format is also designed to be more user

friendly by dividing information into modules on specific clinical questions. Each module has a consistent organization, which will assist users in finding clinically useful and relevant information quickly and easily. This new edition of the practice guidelines on psychiatric evaluation for adults is the first set of the APA's guidelines developed under the new guideline development process. These guidelines address the following nine topics, in the context of an initial psychiatric evaluation: review of psychiatric symptoms, trauma history, and treatment history; substance use assessment; assessment of suicide risk; assessment for risk of aggressive behaviors; assessment of cultural factors; assessment of medical health; quantitative assessment; involvement of the patient in treatment decision making; and documentation of the psychiatric evaluation. Each guideline recommends or suggests topics to include during an initial psychiatric evaluation. Findings from an expert opinion survey have also been taken into consideration in making recommendations or suggestions. In addition to reviewing the available evidence on psychiatry evaluation, each guideline also provides guidance to clinicians on implementing these recommendations to enhance patient care.
